2D Platformer Reflection

1. What was your rapid prototype goal for this project?

My rapid prototype goal for this project was to learn how to transition between different scenes/levels for dynamic environments and flow. Another goal was to integrate animations and sounds within the game to improve immersion.

2. How closely did your final game match your original prototype vision? What changed and why?

My final game matches my prototype vision pretty well despite the shorter production time for this game project. I was able to load indexes through build profiles, and created my own audio track for background music, and created several animations for the main players movement.

3. What is the most technically challenging thing you implemented? How did you solve it?

The most technically challenging thing I implemented was wire transactions between different animations in the animator. It was very confusing creating parameters and writing my code to access and change these parameters so that the animator could change animations live. To solve it I followed the tutorial closely and made sure all my animated clips were made with the correct frames, looped, and right parameters.

4. If you had one more week, what would you add or change?

If I had one more week I would make use of the vertical layered sounds I made but were able to implement due to time. It added another track to the background music when the player would approach an enemy. I would also make my player be able to swim underwater because I created a secret treasure room with the path hidden by water.

5. How does your approach to game development now compare to when you started the course?

My approach to game development compared to when I first started the courses is very different in the way that I can create storylines and environments through a workflow of several scenes rather than one scene. I can also create enemies or npcs that move on their own down a set path, instead of having a static position. I am able to view video games in different layers.
